10 The Small Print – Catalogue

‘Small print’¹⁹ is a fitting title for the catalogue chapter, as the catalogue usually contains all the information that does not necessarily have to be stated in detail in the text part. The results are based on crucial data and often of interest to further interpretations of other researchers. Therefore, in addition to making all basic data available via the scientific data management of the University of Tübingen (Open Research Data Portal²⁰), the most relevant information will be given in the catalogue.

The tables, diagrams and pictures are listed in the order they appear in the text. For each part of the catalogue, an indication of the chapter in which the results can be found will be stated. Basically, those are the chapters 5, 6 and 9 where the

generated results from the collected data were presented. The catalogue will start with the tables from previous publications (chapter 10.1) and the archive studies (chapter 10.2), followed by the list of the collected survey material (chapter 10.3) as well as drawings and pictures of selected survey finds (chapter 10.4). The most extensive part of the catalogue presents the excavated material and information on the different archaeological structures (chapter 10.5; list and pictures of finds, plans of layers and profiles etc.). Eventually, the table with the newly compiled ditched and walled enclosures (far from the south) will close the catalogue (chapter 10.6). As for the text, the short citations will all be found in the bibliography.

¹⁹ Not only is it a fitting title for the catalogue, but ‘The Small Print’ is also a song title of the British band Muse. Some readers may have noticed that especially the last three chapters exhibit titles with musical references reflecting my musical taste. Like throughout the writing process of each PhD-thesis, there are moments when the continuous text does not make any progress. To overcome those phases, I put some effort in finding song titles that best reflect the content of the following (sub-)chapter. By doing so, after having found a fitting title, the so-called writer’s block many times was overcome.

10.1 Table of Published Sites

Research of published works had the aim to achieve an overview of the available information on late prehistoric sites in the province of Toledo, in the autonomous community of Castilla-La Mancha. The most complete database on published Chalcolithic sites of the province should be obtained. This resulted in table 16 and later has been mapped in QGIS with the topographic information deriving from the publications, meaning that some locations cannot be seen as the exact spot the site is situated on (*fig. 104*). The table contains additional information besides the name of the site, such as the municipality, the rural district, the site type (burial, settlement etc.), the approximate dating as well as the publication as short citation.

A major part of the listed sites date to the Chalcolithic but some also to the Late Neolithic or Early Bronze Age. These were included because archaeological research often reveals a repetitive place continuity over centuries. The 103 sites only rarely have been excavated and most of the information originates from surface finds. Excavated sites were almost exclusively the ones investigated by Bueno and her team, including the dolmen in the west of the province and those in the municipality

of Huecas (amongst others Bueno 1991; Bueno et al. 2005a; 2005b). With Valladares I, a rescue excavation is included (García et al. 2008).

The sites remapped in *fig. 104* (also visible in the heatmap generated for chapter 5.1.2, *fig. 13*) show clear site agglomerations, for example close to the autonomous community of Madrid. Especially in the western part of the province, a remarkably low number of published sites could be located. The east of the province of Toledo (La Mancha) revealed amounts close to zero or zero. Mostly due to the PhD-thesis of Muñoz (1998), the municipalities of Seseña, Borox as well as their neighbours in the northeast of the province of Toledo, in the vicinity of the autonomous community of Madrid, the number of the published sites rises again. As stated above, most of the published sites do not only exhibit a chronology restricted to the Chalcolithic but show younger or older structures as well. This result alone points to a place continuity and rather sedentary people and permanent settlements during the Neolithic and Chalcolithic of Central Iberia.

More detailed information can be found in chapter 5.1.1 and 5.1.2.

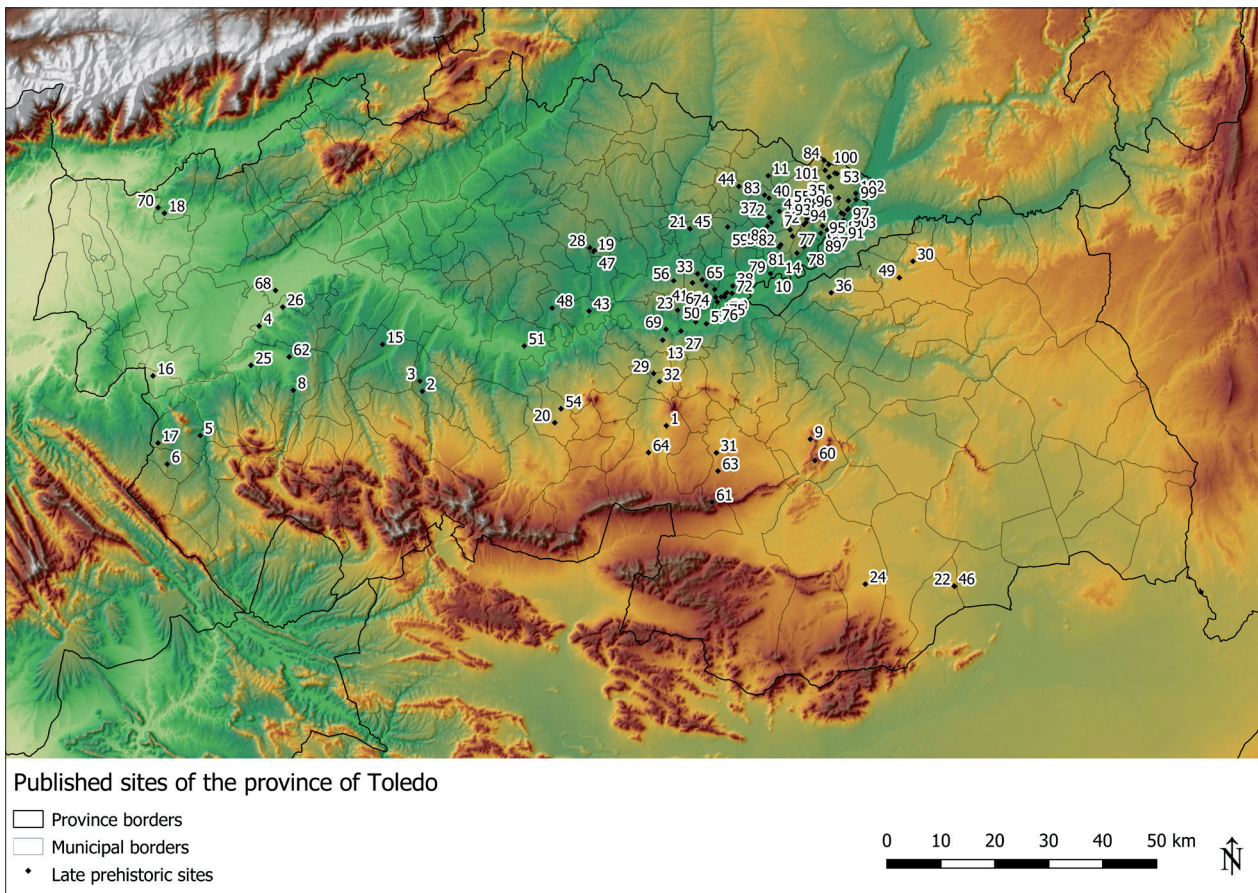

Fig. 104. Late prehistoric sites of the province of Toledo based on published information. A clear cluster can be found along the province borders to the autonomous community of Madrid in the northeast. Further maps can be found in chapter 5.1.2 (*fig. 12 and 13*). Map based on the modified MDT200-TOLEDO © Instituto Geográfico Nacional.

10.2 Table of Sites of the JCCM

After the initial step of the PhD-study – the investigation of publications – research in the archives of the heritage office of the JCCM in Toledo focussed on the mainly unpublished sites of the province shown on the ‘Carta Arqueológica’. The information in this database is for the most part derived from survey activities in most parts of the province. This has been a valuable supplement to the published information, as most of the sites in the archives of the JCCM until that day have not yet been published. The table (**tab. 17*) and the following map (*fig. 105*) show the state of December 2013, when information for this compilation has been collected. Until then 148 of the 204 municipalities of the province of Toledo were surveyed and entered the ‘Carta Arqueológica’.

In the table with the unpublished sites, their name, the municipality they were located in as well as all periods mentioned and present on site were listed. For the mapping, the x- and y-coordinates were included as well.²¹ Because surface finds in most cases cannot be sufficiently chronologically classified as is possible with excavated and radiocarbon dated structures, a wide timeframe is presented in the table often referring to whole periods. Information on the size of a site was unfortunately not stated for each period but for all periods that have been recorded in the area investigated.

²¹ As this information is property of the government of the province of Toledo and to prevent further destruction of the sites by looters or pot-hunters, it was excluded here.

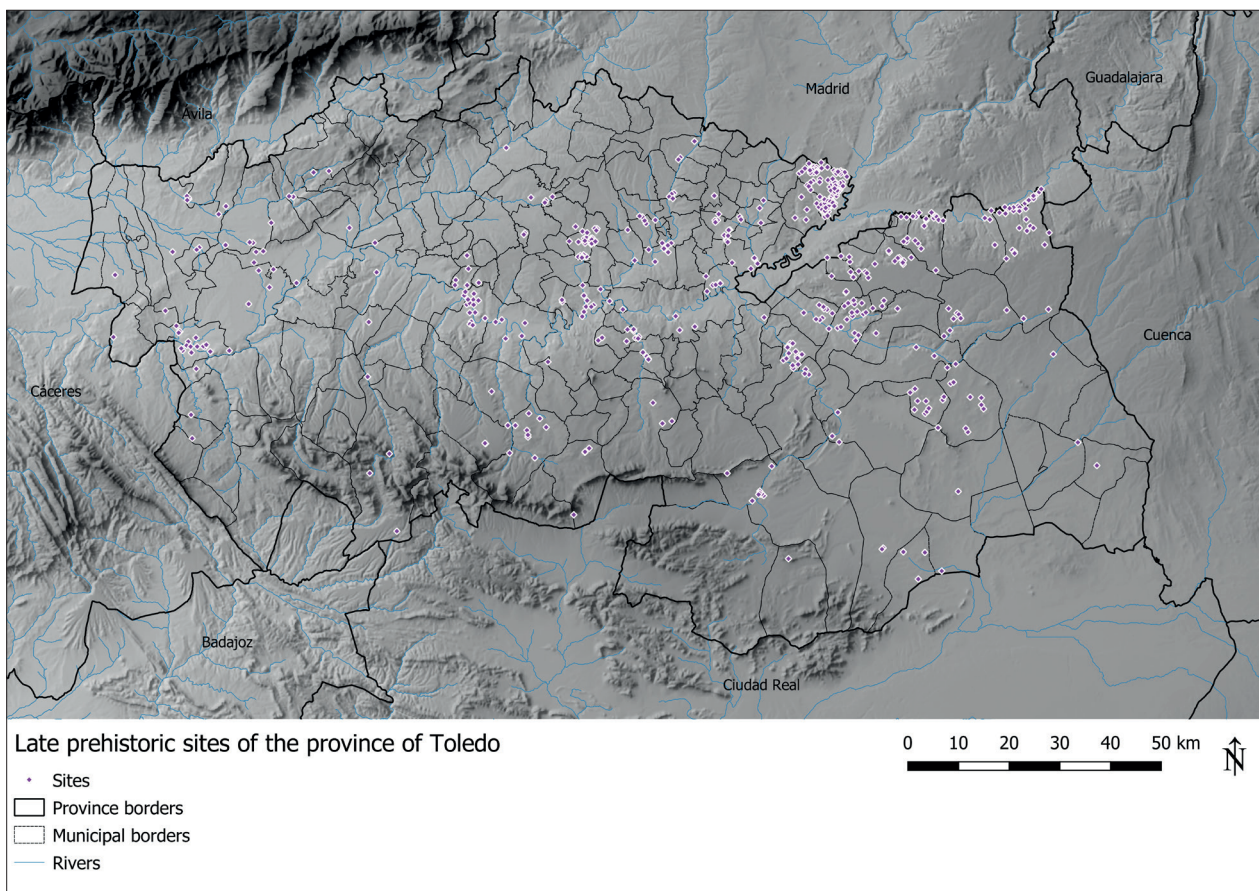

Fig. 105. The map shows all the sites that were listed in the carta arqueológica of the JCCM that were of chronological interest for the project.

Thus, in these cases the exact dimensions of the site during Late Prehistory must remain unknown.

The main condition of admission for one site was that it at least belonged to a prehistoric period or, even better, was assigned to the Neolithic or Chalcolithic time. Until December 2013, 72.5% of the municipalities of the province have been surveyed and a remarkable quantity of sites became visible. Altogether 509 sites were mentioned in archives of the JCCM. In 61 of 148 municipalities no Neolithic or Chalcolithic sites were stated or detected. As for the published ones, a very high number of sites is recorded due to the intensive survey activities in Seseña in the northeast of the province. The maps (see *fig. 13–14, 104–105*) show similar distributions with comparable hotspots for the published as well as the unpublished sites. Again, the west and the southeast (La Mancha) of the province are underrepresented in the database. In contrast to the unpublished data an agglomeration

of approx. 15 sites in the vicinity of Azután becomes visible, also just like a higher number in the northern part of Toledo's Mancha can be recorded.

The research conducted in the archives of the JCCM added new dimension to the prehistoric settlement landscape of the province of Toledo. Such an impressive number of sites is not very surprising when regarding this highly accessible territory in Central Spain with a vast landscape formed by the middle basin of the Tagus River. Still the work at the JCCM revealed an unexpected quantity of areas already surveyed. It added many new sites to the centre of the Iberian Peninsula and filled some of the gaps on the map. Combining the information deriving from the research on the published and the unpublished sites, the province of Toledo now has more than 600 most likely late prehistoric sites. This is an impressive number for the centre once supposed to be deserted (see chapter 5.1.2).

| ID | Name | Municipality (t. m.) | Chronology |
|----|---|----------------------|--|
| 1 | Los Arenales | Albarreal de Tajo | Paleolithic, Chalcolithic, Iron Age, Roman, contemporary |

*Tab. 17: Late prehistoric sites of the province of Toledo named in the archives of the JCCM (part 12/12).

10.3 Table of Collected Survey Material

The survey work in the municipality of Azután and its adjacent municipalities was conducted in 2014. It was aimed to investigate as many accessible areas as possible that already indicated Chalcolithic or late prehistoric finds in the 'Carta Arqueológica' of the JCCM. The focus was on the municipalities of El Puente del Arzobispo, Alcolea de Tajo, Azután, Navalmorelejo, La Estrella and Aldeanueva de San Bartolomé (*fig. 16*, chapter 5.2.2). Most of these sites were located in the valley of the Tagus in Azután and Alcolea de Tajo.

Additionally, intense investigations along the foothills of the Montes de Toledo – besides the fruitful ones in the valley – should examine larger areas. Dense vegetation or inaccessible private land often did not allow such extended surveys, hence the discovery of new sites (municipalities of Navalmorelejo, La Estrella and Aldeanueva de San Bartolomé). After several – in most cases ineffective – attempts, the focus of research was changed to the valley where agriculturally used land allowed a good accessibility. Outstanding results could only be obtained from the southern bank of the Tagus in the municipality of Azután. The finds listed in *tab. 18 all derive from the area of Azután.

Of the 21.6km² that are covered by the municipality of Azután, approx. 208.8ha were investigated. An almost completely surveyed area (except for the fields that were inaccessible due to the height of the crop plants) is situated in the west of the modern village of Azután where 64.5ha were investigated. It is situated on the southern terraces of the Tagus and limited by the Anguilucha Brook in the west, the road to Belvís de la Jara in the south and the village of Azután in the east. Here the best results for the objectives of the project

could be achieved. The entire area is characterised by a difference of only a few meters in elevation. As only a little more than 350 pieces of the 1827 collected finds came from other parcels of Azután, it became obvious that the focus of the following campaigns should be on this special area west of the village.

Here 4783 surface finds were recorded, of which 1473 artefacts were collected. Of the total recorded material, 25.36% were wheel-made pottery and other post-prehistoric finds. 74.64% indicate late prehistoric human activity, especially of the Late Neolithic and the Chalcolithic periods. Because of the dense distribution of the recorded surface finds – often more than 300 within a radius of 100m – it was assumed that at least 30ha were settled during Late Prehistory (*fig. 21*, chapter 5.2.2). The dense clusters of the material – together with the fact that the not yet surveyed fields may reveal similar amounts of finds – suggest that the site might expand over the whole area of approx. 90ha between Azután, the Tagus River and the Anguilucha Brook.

For the interpretation (e. g. use of territory, settlement preferences throughout different periods) of the scattered surface finds in the municipality of Azután, see chapter 5.2.2.

The table shows the most important information on the diagnostic as well as non-diagnostic surface finds of Azután. Some comparisons for the prehistoric pottery sherds of that area were made with the material depicted in the paper of J. M. Rojas (1999). The number/code for the material in the first column is composed after the following: (area=Azután)-(year=2014)-(parcel)-(collection method=Survey/Prospection)-(number) → AZ-14-000-PS-000.

| Number (Code) | Parcel | Polygon | Classification | Shape | Period | Sherd type | Temper/Material | Colour of Fracture | Decoration | Description |

10.4 Image Documentation of the Survey Material

For the image documentation of the collected survey material, predominantly drawings of diagnostic rims of pottery deriving from six different parcels of the polygon 502 were selected. They are all surface finds from the area limited by the Tagus River in the north, the village of Azután in the east, the road to Belvís de la Jara in the south and the Anguilucha Brook in the west. Most of the material has only been recorded in the table and not photographed due to the level of its fragmentation. Pictures were taken of a few representative examples only.

The rims were grouped according to type – for example rounded, flattened or outward turned rim – and according to vessel type (plate, bowl, pot) whenever possible. Most of the rim sherds presented here were documented in parcel 187 that, after the geomagnetic survey, was identified as apart of a double-ditched enclosure (El Prado, chapter 5.3.2 and 5.4). The images drawn by J. Verdonkschot will be presented in ascending order according to their number, starting with parcel 187 and ending with 209 (*fig. 106–133*). Each rim

sherd is displayed with its individual code. This enables its traceability within the table of appendix 3 (**tab. 18*) and to obtain further information on temper, colour, decoration and more. The figures will be described only with short captions containing information on rim and vessel type, as data such as code, polygon and parcel are already stated in the images.

Eventually, the compilation of rims will be closed by a selection of photos of finds taken by the author to illustrate the sometimes extraordinarily good preservation of surface finds and to gain an impression of the material (*fig. 134–143*). Again the colour photos will be depicted with their code to trace the pieces in the list of the survey material (**tab. 18* in appendix 3). Following the presentation of these selected finds, the next chapter will treat the material excavated in the year 2015 in the area named El Prado. In this case, more pictures of the diagnostic material were taken, as the excavated material derived out of secured archaeological structures that all could be carbon dated as well.

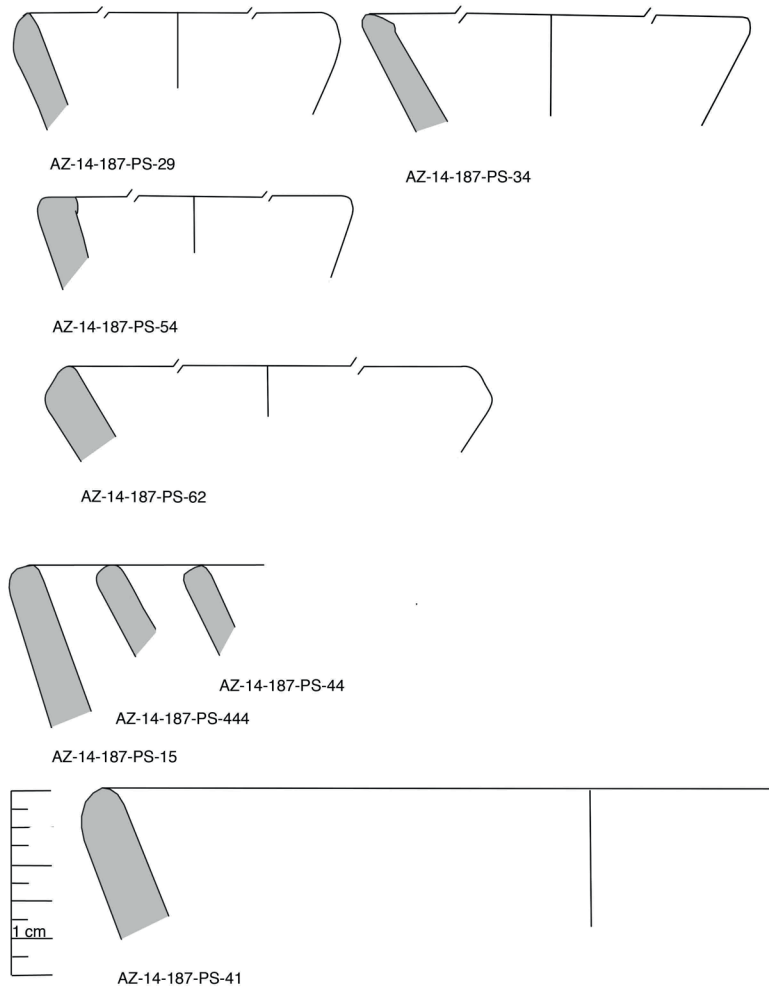

Fig. 106. Slightly outwards inclined rims of bowls with rather flat or pointed ends, except for AZ-14-187-PS-41 which is rounded (polygon 502, parcel 187; scale 1:2).

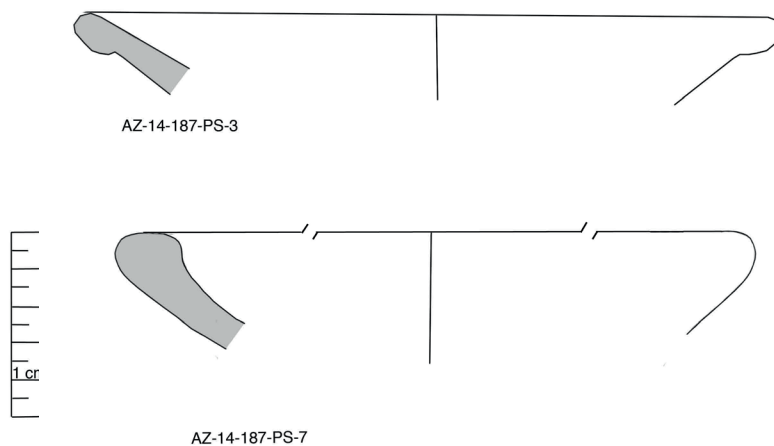

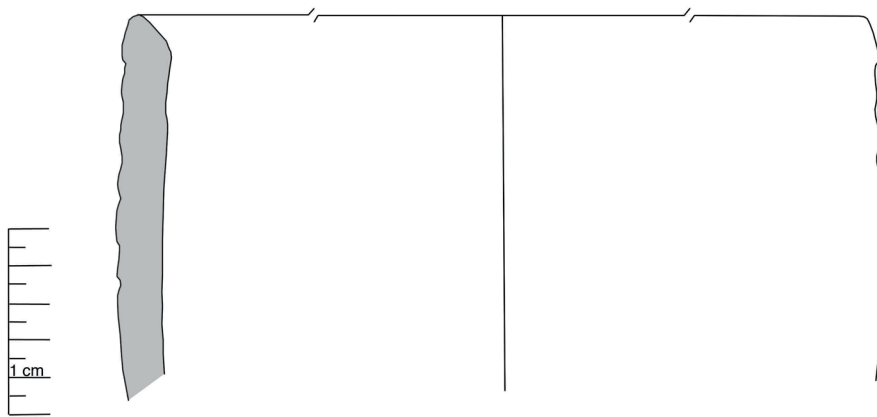

Fig. 107. Rims of plates with thickened ends. AZ-14-187-PS-7 showing a tendency to an almond-shaped rim (borde almendrado) (polygon 502, parcel 187; scale 1:2).

Fig. 142. Survey find AZ-14-221-PS-1. Small granite axe with a partially polished surface and edge.

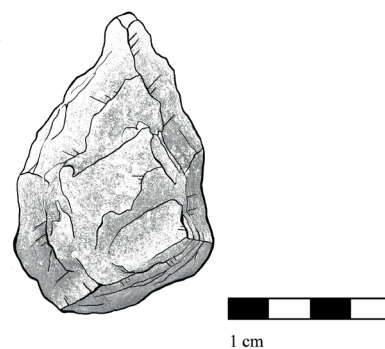

Fig. 143. Survey find AZ-14-262-PS-12. Biface made of quartzite found in the area that was dominated by Palaeolithic material south of the modern village of Azután.

10.5 Excavated Material from El Prado 2015

This part of the catalogue will serve to state the information not included in chapter 6.2. Information given in chapter 6 will not be repeated. For details on measurements of the structures, quantities of different material categories, shape of pottery, detected animal species and special finds, the associated chapters can be considered (chapter 6.2.1–6.2.3). Additionally, information on dating and other scientific analyses can be found in chapter 6.3. In-depth information on each find can be found in **tab. 20*. The focus will be on the rim types, temper and firing as well as on the presentation of pictures and drawings of recorded finds and the different layers of each structure. Profile pictures can be found in the text in chapter 6.2.1 and 6.2.2.

All in all, in autumn of 2015, only a small area with two trenches (SPS and SCE) was investigated. They uncovered an area of only 50m² and were based on the previously conducted geomagnetic measurements in that area. Therefore, a targeted opening of the trenches was possible within the agglomeration of pits as well as an investigation of the inner ditch of the double-ditched enclosure of El Prado. After 0,4–0,5m of the topsoil (humus layer and mixed plough horizon), the detected finds as well as the structures uncovered were exclusively prehistoric material. At least 3892 finds were recorded in both trenches and some of them individually measured with their exact geographical coordinates. SPS revealed four pits, three of which were completely or partially excavated. SCE investigated a part of the inner ditch of El Prado and a pit that was dug in the backfill of the ditch. The main phase of usage for ditch and pits could be dated to the second half of the 4th mill. with a focus around the turn of the 4th to the 3rd mill. BC. The strong calcareous sinter covering all finds, especially in the upper layers that became less the deeper the finds were recorded, is worth mentioning as well.

Looking at the potsherds of both trenches, reducing and oxidating firing is about equally common (defined after Dvorská 2001, 49, fig. 3). The main size of temper is medium, directly followed

| | |
|--------|--|
| Coarse | At least two visible pieces of 4mm and bigger sizes |
| Medium | 1–2 to 4mm pieces and includes a lot of temper but below 4mm |
| Fine | 0 to max 2mm, but predominantly 1mm. 2mm only if small no. of temper |

***Tab. 19.** The conditions for the definition of the tempering type of each sherd of the excavated material of El Prado.

by fine, while the smallest number of sherds has coarse temper. The definition of coarse, medium and fine was determined on the basis of the excavated pottery and the collected survey material (**tab. 19*). Amongst others, quartz and shells were used as temper as well as crushed pottery and organic components (straw, manure etc.). Rounded rims are predominant, followed by flattened rims and less than 25% of all rim sherds have a pointed profile.

Among the lithic artefacts, flakes represent the most numerous group. Besides flakes, blades (14 pieces) and bladelets (6), perforators (8), arrowheads (6) and cores (5) have been documented, as well as two scrapers, a pestle, a grinding stone and a polished axe.

The different structures detected in the two excavation sections will be presented according to their listing in **tab. 18*. Starting with SPS and structure SW, followed by structures W, N and E, closing with SCE, structure CS and the ditch.

10.5.1 Structures of Trench SPS

Trench SPS was planned to investigate the cluster of circular anomalies (pits?) that became visible through geomagnetic measurements in the southern part of the interior of the double-ditched enclosure. A part was chosen that showed an anomaly of almost 4m in diameter. The initial assumption was that this might turn out to be the foundation of a dwelling. When opening the 5 x 5m trench to uncover the complete dimensions of the ‘dwelling’

this anomaly eventually turned out to be four pits that were not interconnected. Their depths as well as the short distances between them caused the impression of just one structure in the geomagnetic image.

The pits were named after the compass direction in which they were located within the excavated area: southwest, west, north and east. Pit SW was the only one that could be recorded to its full extent and depth. Pit E was investigated probably completely in its southern half and pit W was excavated in its eastern part, but not to its base. Structure N had to remain untouched except for the surface size and finds in layer 1. This situation was the result of the limited time of only four weeks left for the study of this area of El Prado.

First additional information of the fully excavated pit SW (temper, firing, layer and find images) will be given, continued clockwise with the other structures within the investigated section. All in all, the structures uncovered in SPS made up 53.8% of the total number of finds that were recorded and processed during and after the excavation. Thus, the finds were very evenly distributed across the two trenches.

Pit SW (fig. 144–150)

In general, pit SW contained a very low number of typologically diagnostic material, barely any bones or charcoal, which was the reason for the difficulties of dating (chapter 6.3.1). This becomes evident again when looking at the rims because only five have been found in the structure. All of them are of the rounded type. Having a closer look at the firing of pottery, 40% of the 100 sherds were fired oxidating and 60% under reducing conditions. The vast majority of them (70%) showed a medium size temper (fig. 144).

Surface treatment appeared in 14 cases as brownish, red or orange slip on the in- and/or outside of the sherd. Rarely an application of ochre could be detected. Two sherds showed a decoration: stripes on one sherd and on another an incised pattern of triangles (fig. 145).

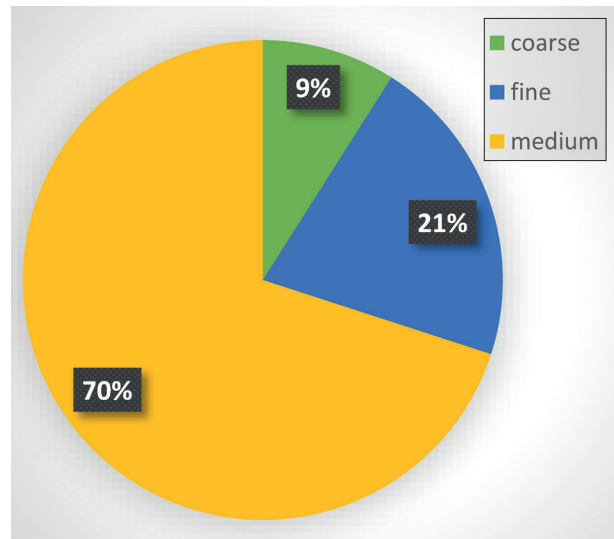

Fig. 144. Within the pottery found in pit SW a medium temper clearly dominates, followed by fine and exceedingly few sherds have a coarse temper.

Fig. 145. Two sherds with decoration, however the upper striped one could also be regarded as showing a surface treatment while the lower one has real incised decoration.

Fig. 146. Rim sherds of bowls and a plate deriving from the backfill of pit SW (scale 1:1; 1:2).

Pit W (fig. 151–162)

The documented structure was situated in the west of trench SPS and therefore named pit W. The most common find category was pottery. Only the eastern half of it was investigated but could not be excavated to the base within the available time in the field. The radiocarbon dates obtained for the pit (chapter 6.3.1) were differing, as one dates to the Neolithic period (turn of the 6th to the 5th mill.) and another one to the Chalcolithic period (turn of the 4th to the 3rd mill. BC).

Of 458 sherds, 252 were fired under reducing conditions, 229 under oxidating ones and four sherds seemed to have been subject to mixed

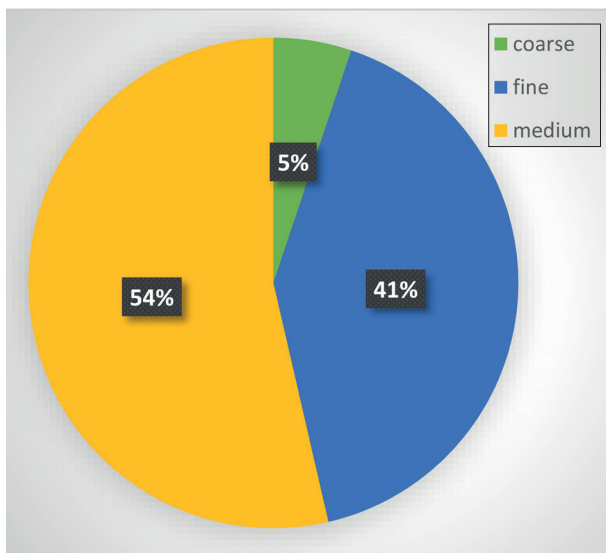

Fig. 151. Within the pottery found in pit W a medium temper dominates, followed by fine and exceedingly few sherds have a coarse temper.

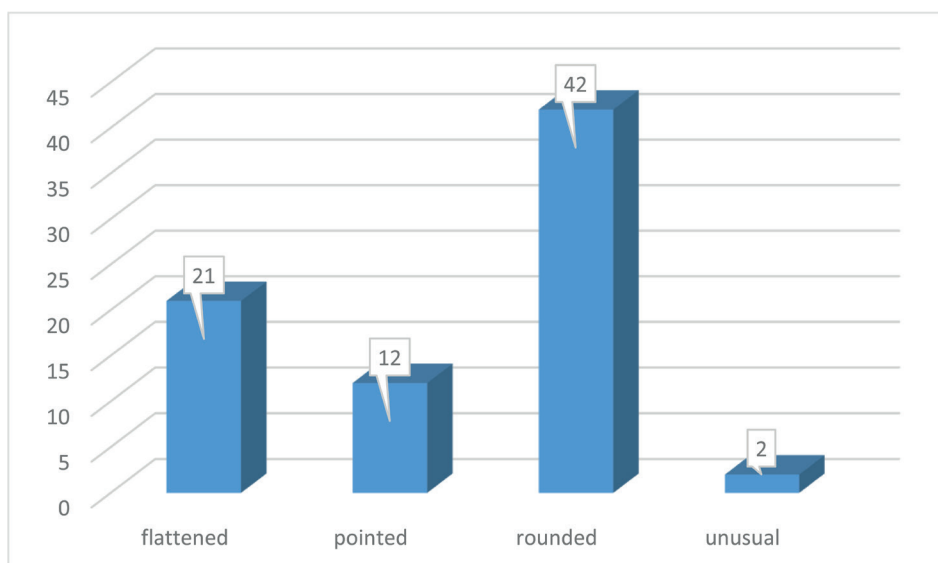

Fig. 152. The highest proportion of rims is presented by the rounded type. Two sherds showed an unusual rim shape.

firing processes. The highest number of the 77 diagnostic rim sherds belongs to the rounded type (over 50%), followed by flattened rims and pointed ones. In two cases, the rims could not be assigned to a certain type and were described as unusual (fig. 152). With all recorded sherds, the dominant type of temper is medium again, however, the number of fine tempered sherds is high as well. The smallest amount are coarsely tempered sherds (fig. 151). Having a look at the surface treatment and the decoration, only a very small number of sherds shows the application of a slip. Only three sherds have remains of red, grey and orange slip. Three further sherds exhibit decoration: one with a perforation, one with incised lines and another with a painted black band parallel along the rim on the inside of the vessel on red ground (fig. 153).

The higher number of painter's mussels especially in layer 10 compared to the other structures as well as the perforated shell of a snail should be emphasised (chapter 6.2.2, fig. 74 and 75).

Pit N

Pit N was not excavated due to temporal reasons and, except for the documentation of layer 1, remained untouched. 21 finds were collected from the surface of layer 1 only and none of them was a diagnostic one. Because of the lack of bones on the surface, the structure was not dated. Even if bone would have been present, it might have been part of the mixed plough horizon.

Fig. 153. Two sherds that might be decorated. On the left side a perforated rim sherd, on the right side a rim sherd with the remains of a black parallel line right under the rim.

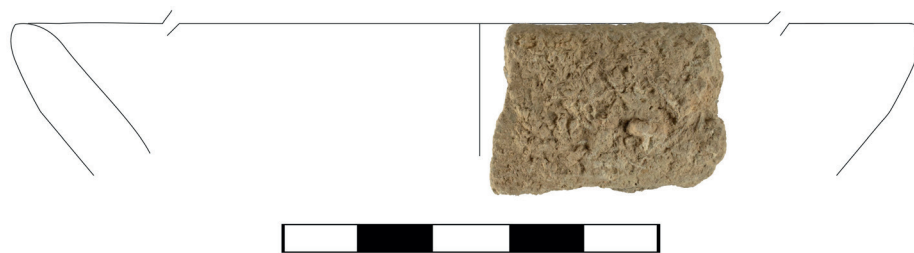

Fig. 154. Rim sherd of an open bowl found in layer 3 of the eastern half of pit W (scale 1:1).

Pit E (fig. 163–174)

This structure was situated in the east of the trench and was therefore named pit E. It can be assumed that by the end of the excavation the last layer of the southern half of the structure reached the base of the pit. Thus, only half of pit E has been investigated. The radiocarbon dates reflect a very clear chronology. All three results pointed to the last century of the 4th and the first century of the 3rd mill. BC (turn of the millennia). None of

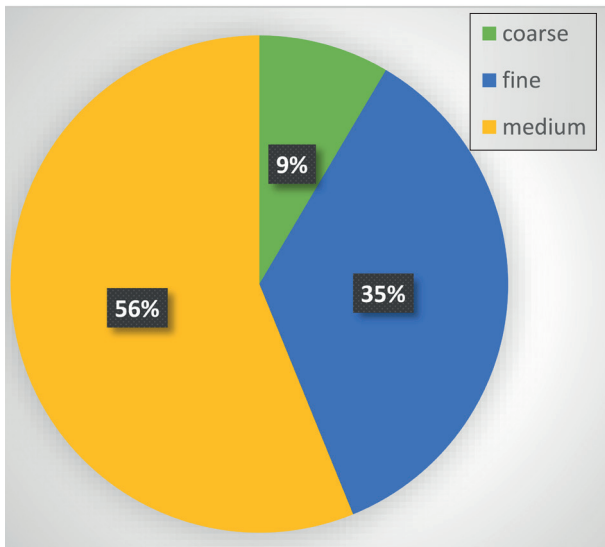

Fig. 163. Among the pottery found in pit E a medium temper dominates, followed by fine and only few sherds have a coarse temper.

the dates derived from material from the assumed bottom of the structure (chapter 6.3.1).

Like in all the recorded structures, the dominant find category was pottery. The 447 studied sherds were almost evenly fired under reducing (227) or oxidating (220) conditions. 59 rim sherds belonged to the pointed, flattened and rounded rim types. Here the rounded rim (28 pieces) is the dominant type with almost 50% of the total number, followed by flattened rims (fig. 164). In structure E, tempering with sherd particles increases. The most common temper is of the medium size (56% of the 447 sherds) and like in other structures followed by a fine temper, while coarsely tempered sherds are the smallest group (fig. 163).

Having a look at the surface treatment, 19 sherds showed an orange, red, beige, black or brown(-ish) slip on the in- or outside. One sherd seemed to have been polished on the inside. Decoration or handles are found in seven cases. On two sherds, hints of paint were found; one with a yellow triangle on orange ground and another that was painted with black colour on red ground right below the rim (chapter 6.2.2, fig. 66). Another sherd with a bend, two with one perforation each and two more with knobs were recorded.

The detection of the upper part of a dog's vertebral column was unique for the site (chapter 6.2.2, fig. 68).

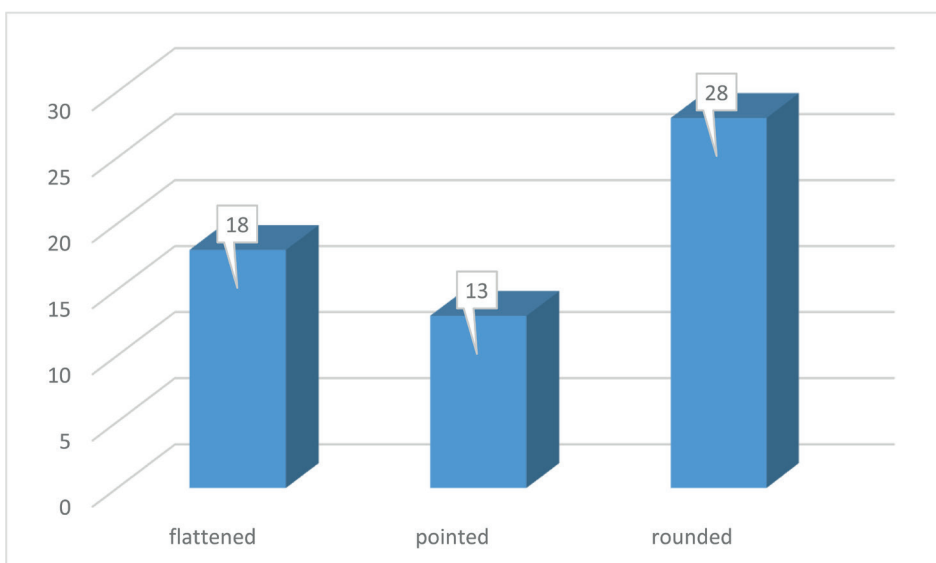

Fig. 164. Most of the rims from the southern half of pit E have a rounded profile.

10.5.2 Structures of Trench SCE

Trench SCE was planned exactly above a part of the inner ditch of the double-ditched enclosure. It was opened precisely and excavated by hand to find out more about the construction and filling of the ditch. The excavated part was situated at one of the rare interruptions of the enclosure, where inner and outer ditch were connected with a short horizontally running ditch. This corner situation was studied within the 5 x 5m trench.

The somewhat darker spot visible in the magnetogram where the ditch bends eastwards in direction of the outer ditch (interconnecting ditch) turned out to be a pit that was excavated in the backfill of the ditch, thus creating an excellent *terminus post quem*. This archaeological structure was named 'Corner South' (pit CS). At the end of the excavation in 2015, a complete profile of the ditch had been obtained and a part of its backfill was investigated down to the base of the V-shaped structure. The pit could be studied completely and the whole negative was documented.

Additional information of the fully excavated pit CS (temper, firing, images of layers and finds) will be given, closing the discussion of this part of the excavation with information on the backfill of the ditch. The structures uncovered in SCE amount to 46.2% of the total number of finds that were recorded and processed during and after the excavation. With 53.8% of finds in trench SPS, the finds were very evenly distributed in the two trenches.

Pit CS (fig. 175–188)

The location of pit CS has been described above already. Of six samples sent to be analysed for radiocarbon dating only one deriving from the upper part of the filling of the pit provided a result. As most of the pits, pit CS dates to the turn of the 4th to the 3rd mill. BC as well (3011–2894 calBC; chapter 6.3.1).

248 of 423 potsherds were burned under oxidising conditions and 175 underwent a reducing firing. Among 70 rim sherds, flattened and rounded rims (24 each) are predominant with 22 pointed rims, the rim forms are more or less present in equal numbers (fig. 175). Fine temper dominates with 51% of the total amount and only 3% were coarse (fig. 176). Sherds were reused as temper and an increase of crushed sherds was observed for the sherds found in the deeper layers of pit CS. Within the pottery repertoire of the other pits, medium temper clearly outweighs the other types.

Surface treatment or decoration of sherds was barely or not at all present in pit CS. Only nine cases of surface treatment could be recorded: orange, red, brownish, beige, grey and black slip on the in- or outside surface. Just one sherd had a knob (possible handle).

A special feature within the material uncovered in pit CS was the goat horn in layer 7. The perforated slate disc from layer 4 can be counted among the rather exceptional finds as well (chapter 6.2.1, fig. 49 and fig. 54).

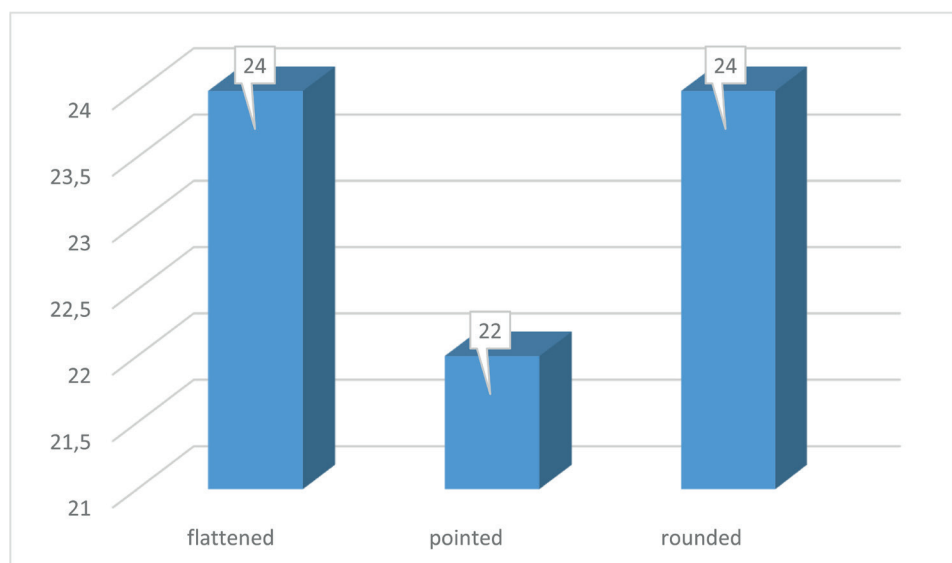

Fig. 175. Among the rims of the backfill of pit CS the rim types were almost evenly distributed; however, flattened and rounded rims were slightly more represented.

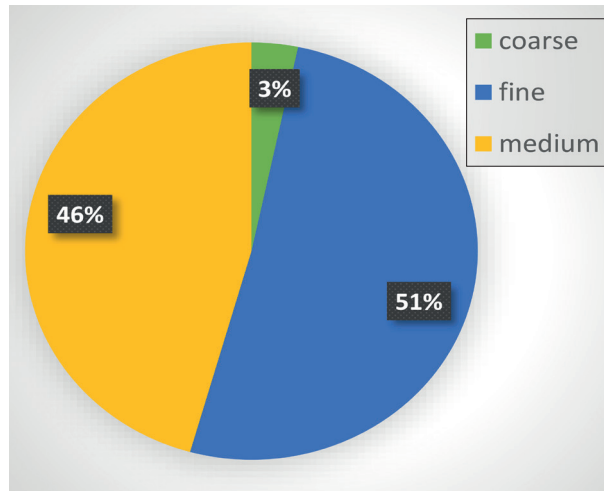

Fig. 176. Among the pottery found in pit CS a fine temper slightly dominates, followed by medium and only very few sherds have coarse temper.

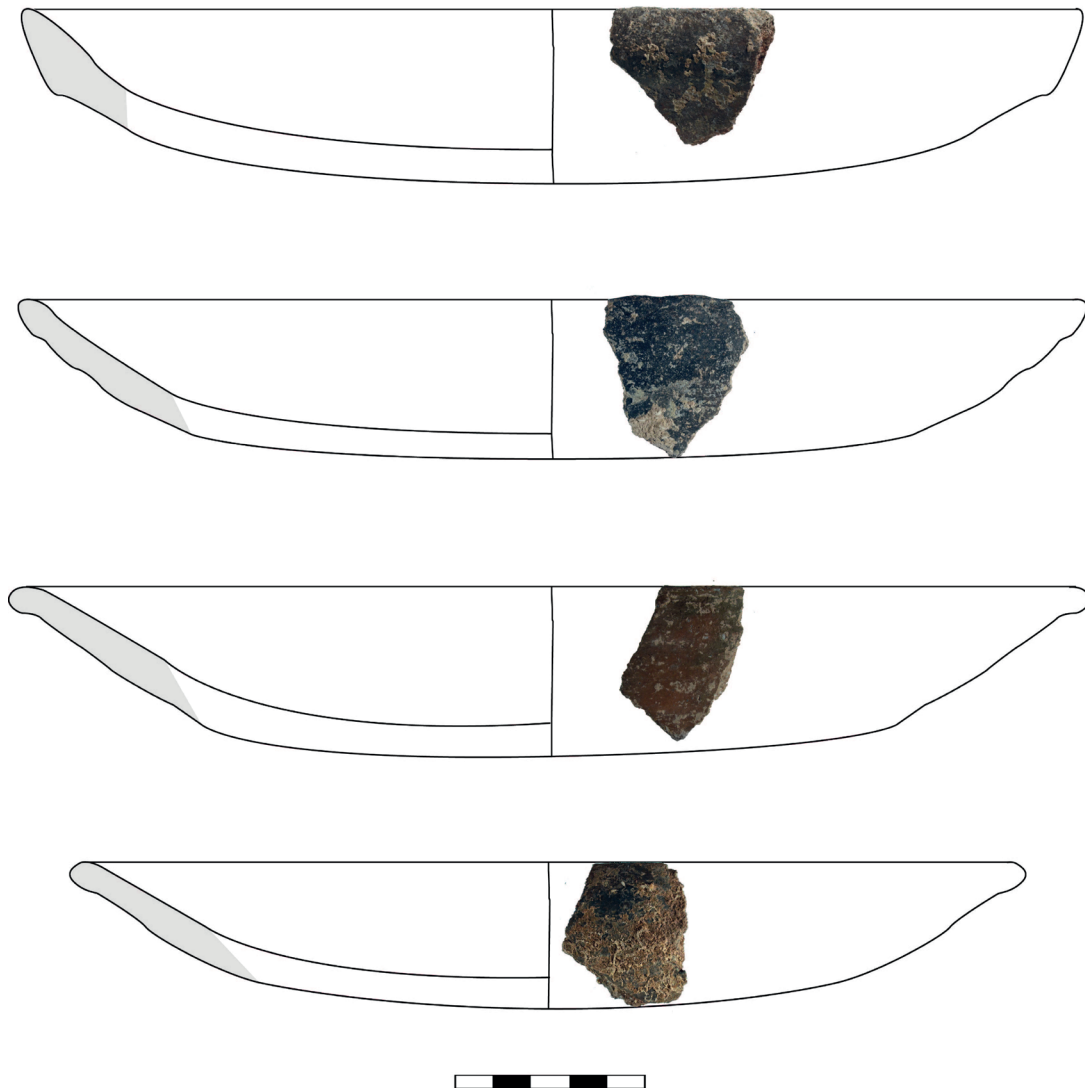

Fig. 177. Reconstructed plates from the upper layers of pit CS (scale 1:2).

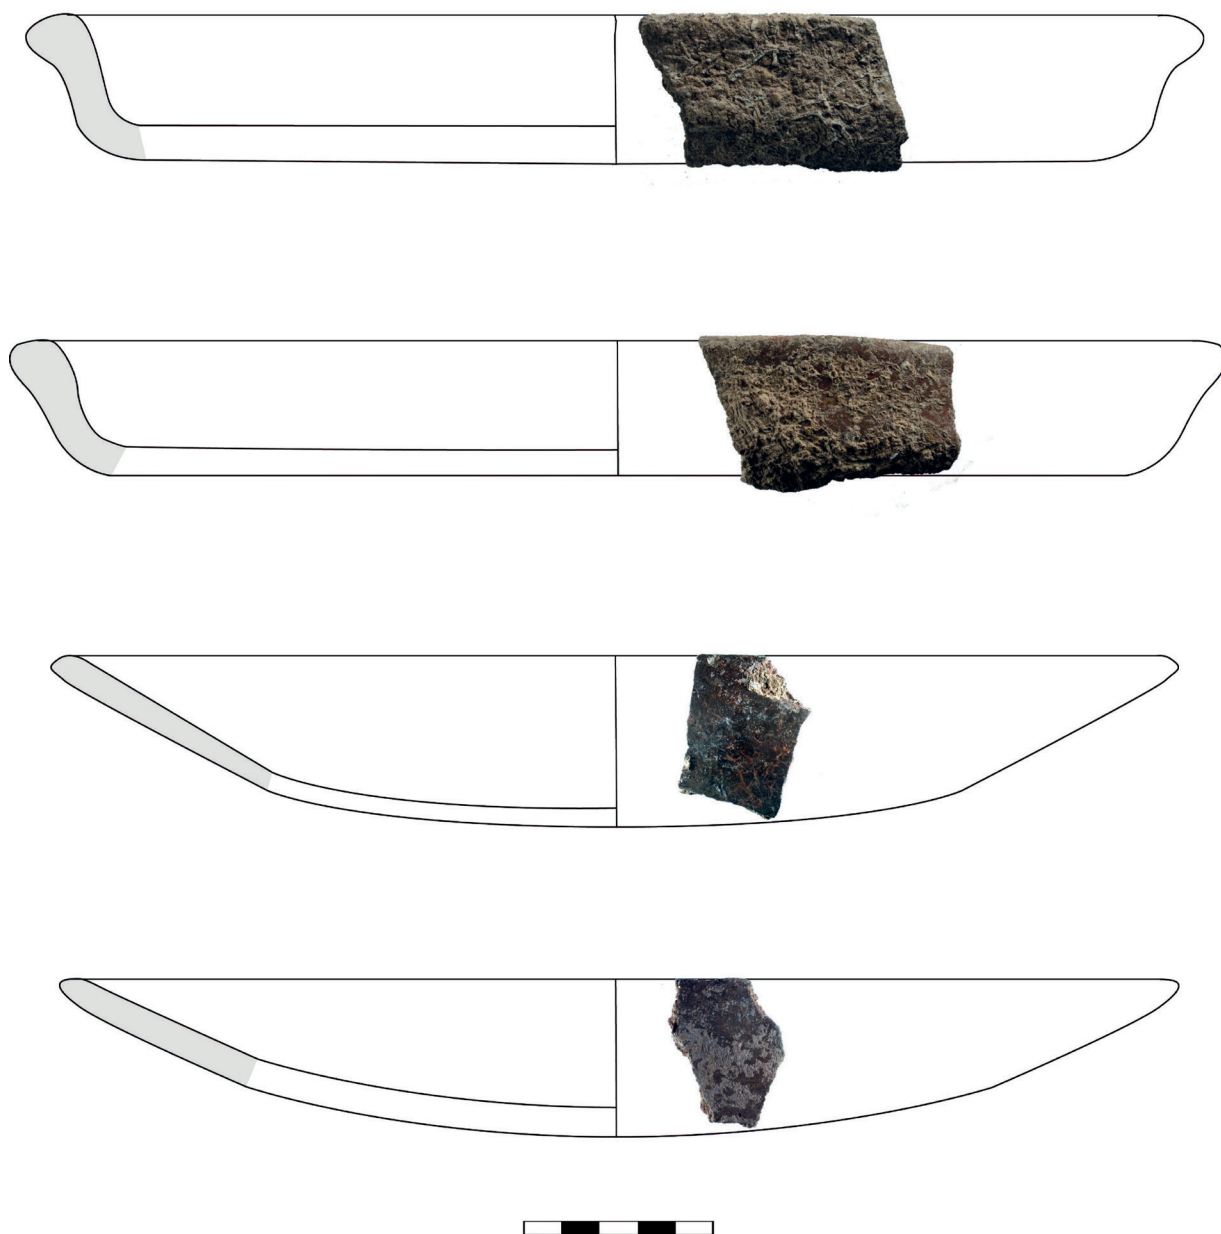

Fig. 178. Reconstructed plates from the deeper layers of pit CS (scale 1:2).

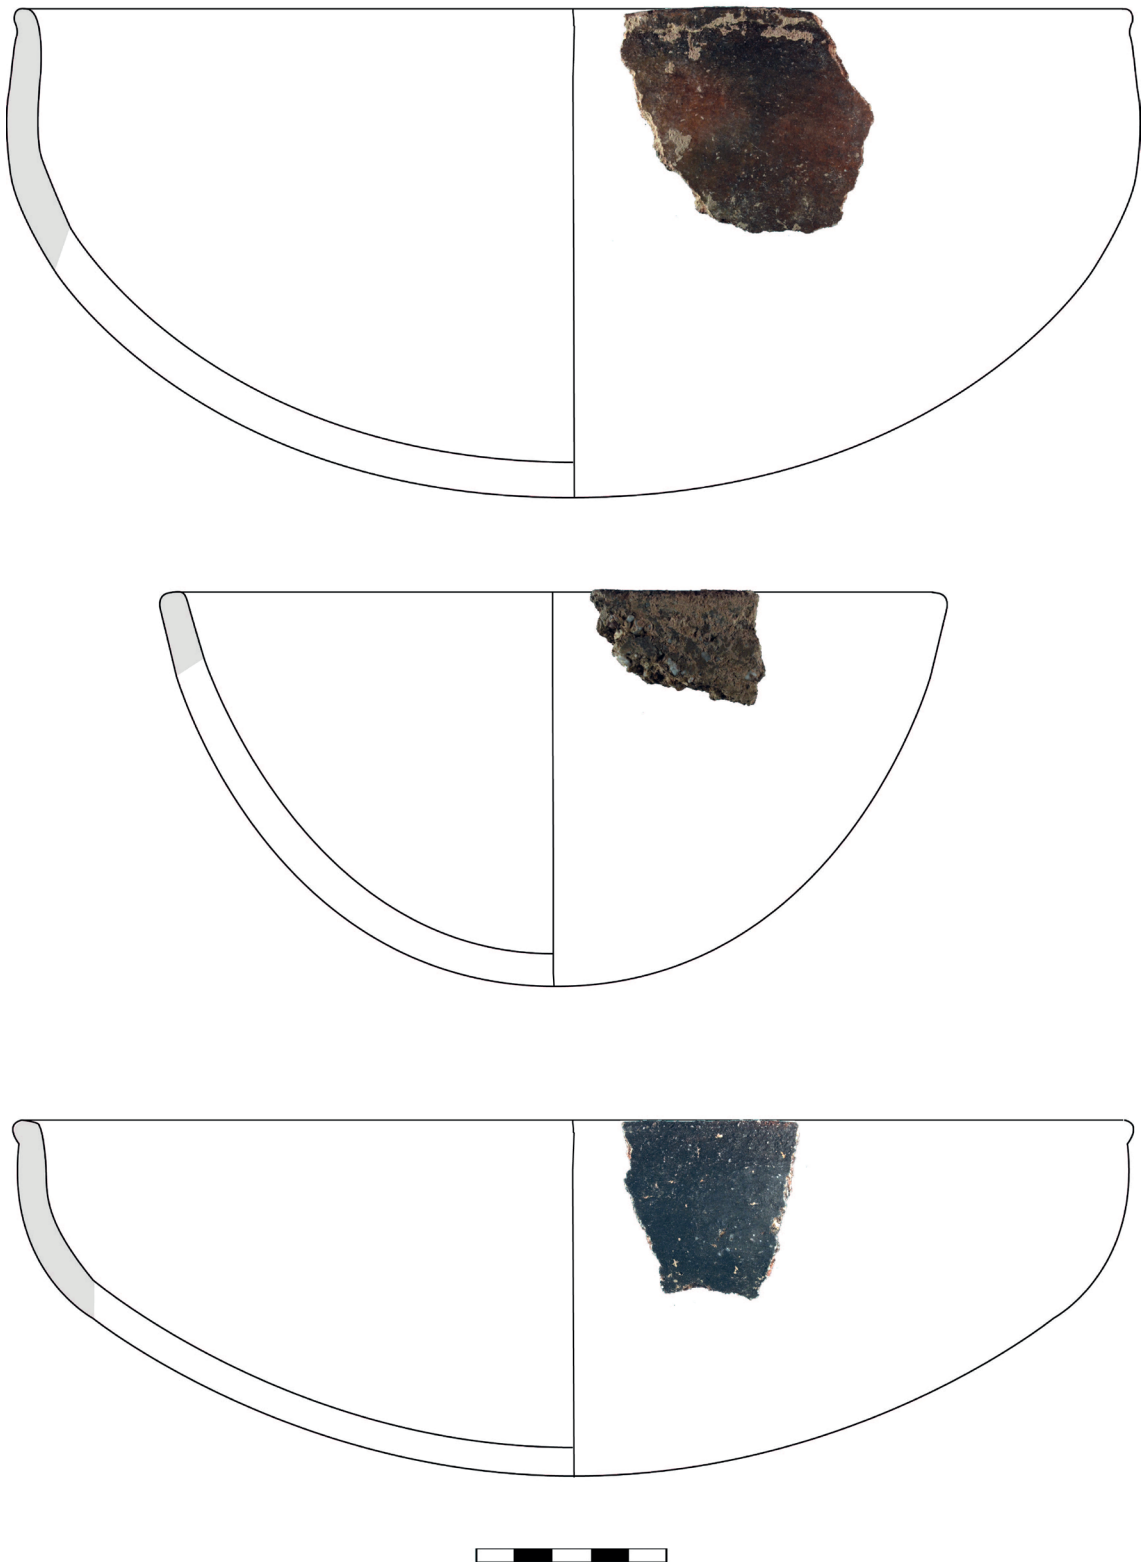

Fig. 179. Reconstructed bowls from the upper backfill of pit CS (scale 1:2).

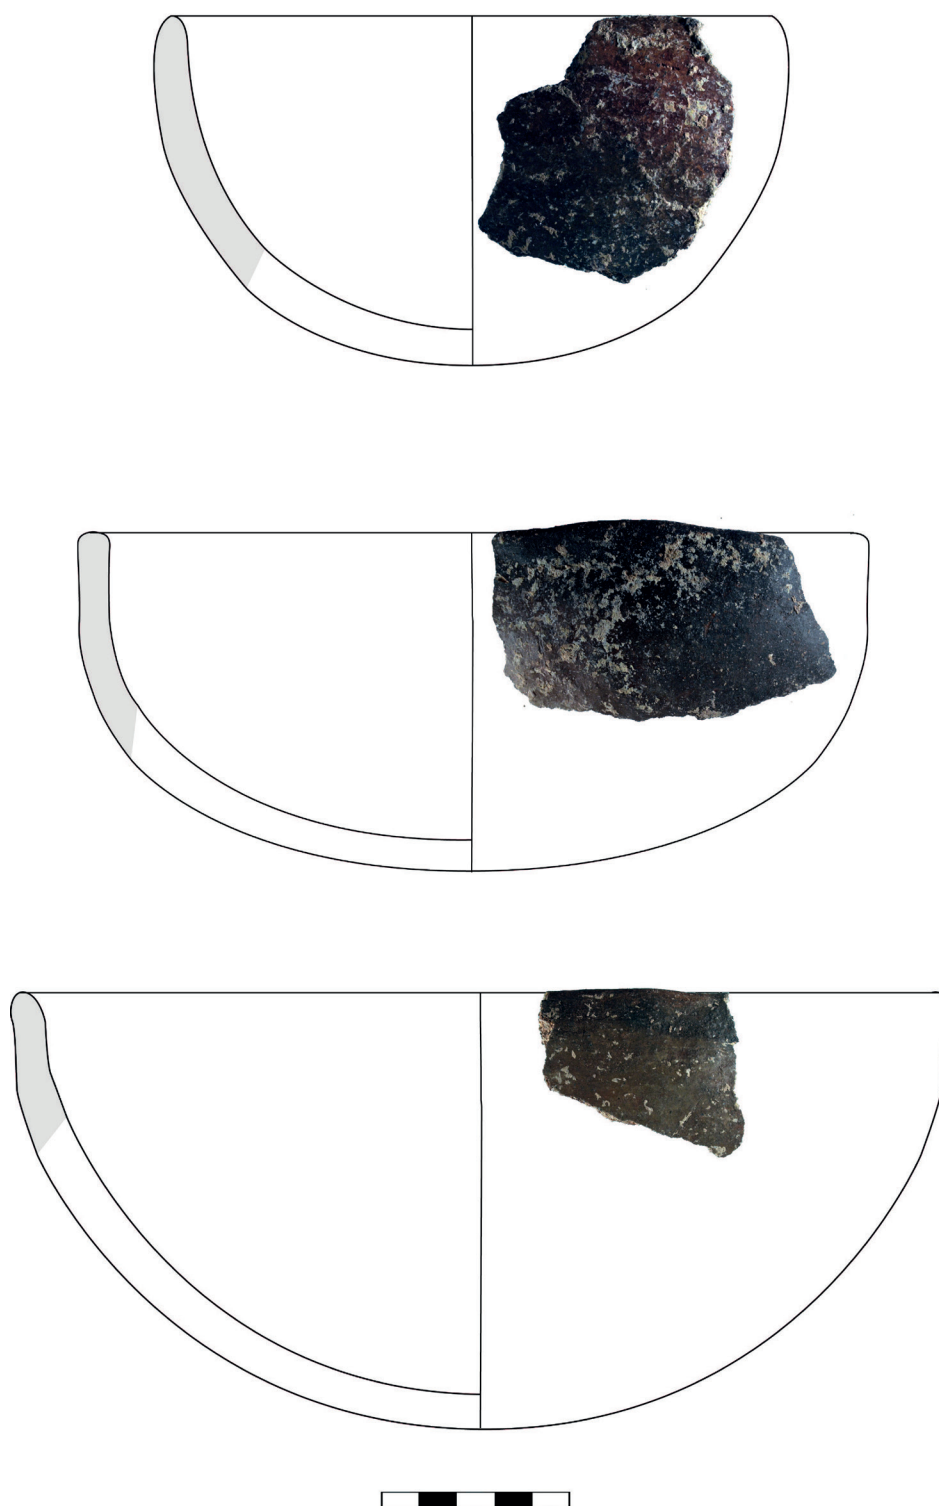

Fig. 180. Reconstructed Chalcolithic bowls (scale 1:2).

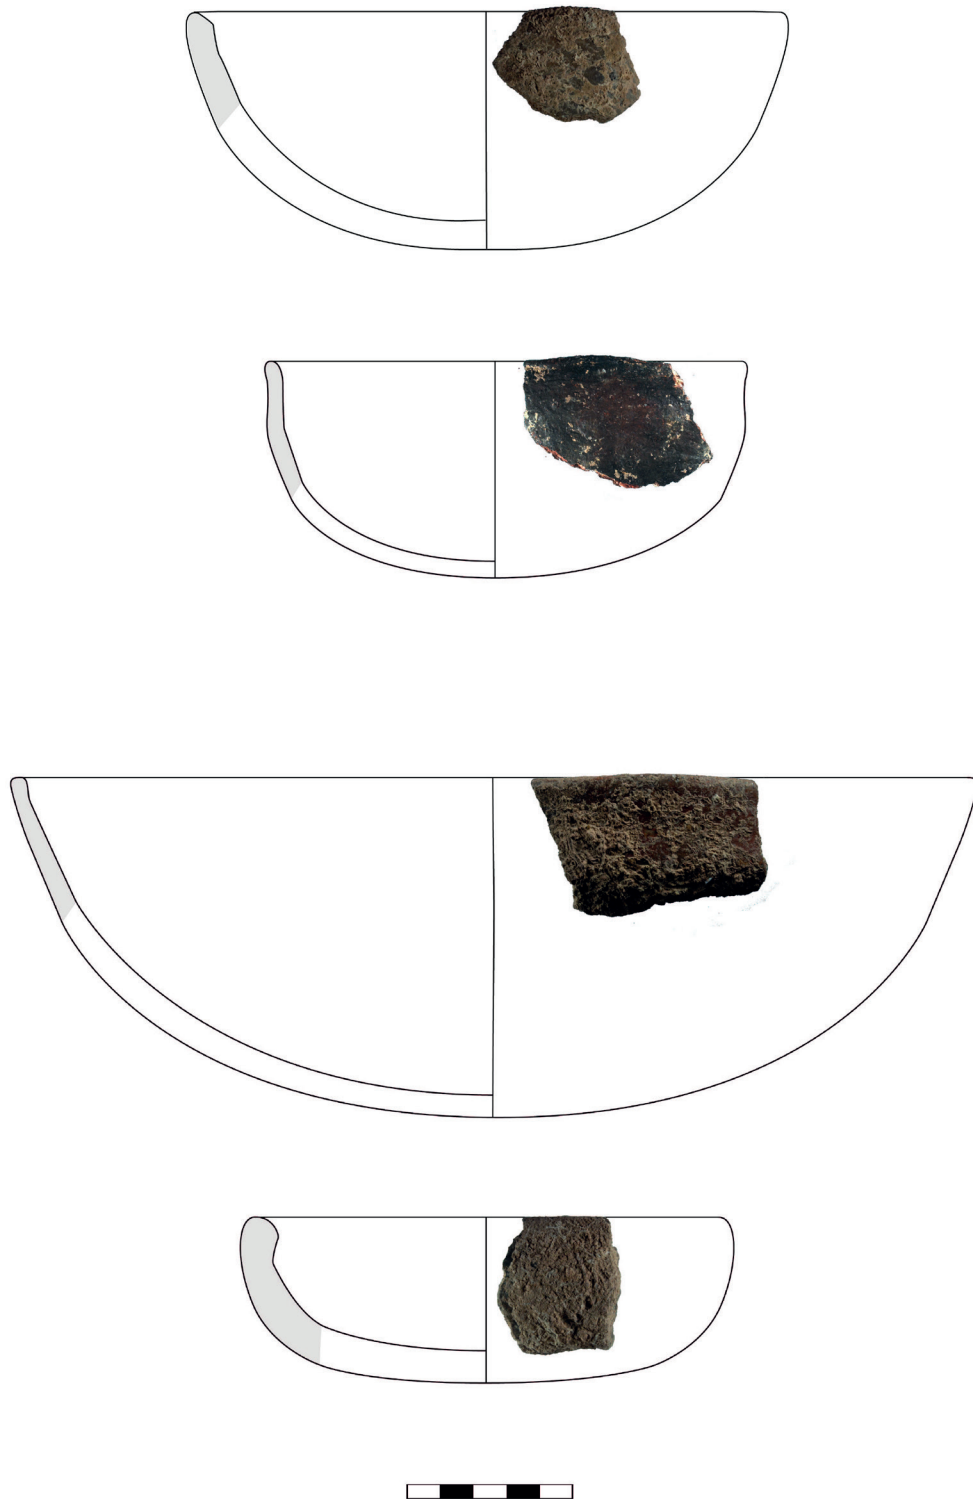

Fig. 181. Bowls with different rim types found in the middle and deeper layers of pit CS (scale 1:2).

Ditch (fig. 189–200)

The main cut through the inner ditch to obtain a complete profile was made at the southern profile of trench SCE. Further parts of the backfill of the ditch were also investigated, however, due to time restrictions, not down to the bottom. Of seven samples that were sent to the radiocarbon laboratories, luckily one bone (from approx. 1m above the bottom) and one charcoal sample (from approx. 0.8m above the base) produced results (chapter 6.3.1). Both date to the second half of the 4th mill. BC, with the more accurate date of the bone dating between 3356 and 3262 calBC.

Like in the other excavated structures, pottery is the dominant group of the documented material. Of the 341 sherds, 215 pieces were fired under reducing conditions, while 126 were fired under oxidating conditions. Only the sherds from layer 3 onwards were taken into account because the ones from layer 1 and 2 derived from the humus and the mixed plough horizons and a clear allocation to the ditch was not given, as they might come from pit CS as well.

22 rim sherds out of 53 have a rounded profile, while 16 are rather pointed and 15 flattened rims (fig. 189). As for pit CS, compared to the material deriving from the pits in trench SPS, a fine temper is dominant with the pottery of the backfill of the inner ditch. It is closely followed by a medium temper and only 6% of the studied sherds were defined as coarsely tempered (fig. 190). In 54

cases, red, brownish or orange slip on the outside or the inside surface was documented. A perforated sherd, a sherd with incised lines and three with so-called knobs (possible handles) – including in one case only the remains of a knob – are listed as decorated.

In comparison to the other structures, the part of a human skull (predominantly *Os frontale*) that was discovered close to the eastern profile of trench SCE is an outstanding find (chapter 6.2.1, fig. 48).

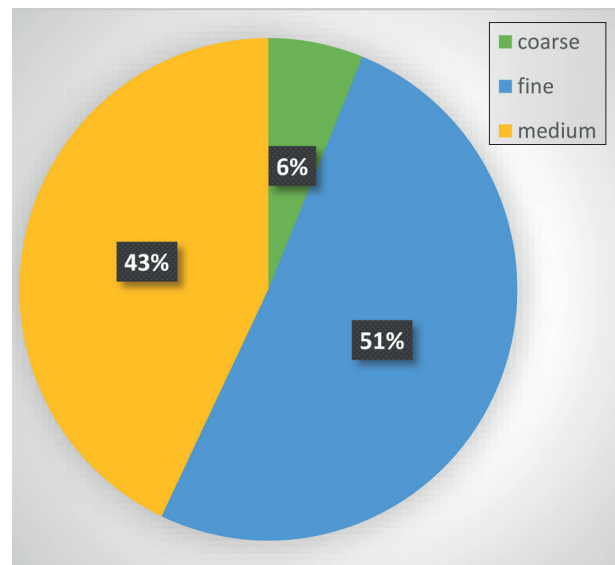

Fig. 190. Among the pottery from the inner ditch fine tempered clay predominates, followed by medium tempered examples, while there are just a few sherds with coarse temper.

Fig. 189. Among the rim sherds from the backfill of the ditch most are rounded, followed by pointed and flattened shapes.

10.6 Table of Ditched and Walled Enclosures

As previously only the enclosures of the southern parts of Iberia were mapped and investigated to a more detailed extent, the other enclosures of the Iberian Peninsula that were published until July of 2017 were now visualised as well. Further information was collected to compare these enclosures as far as possible. This collection resulted in chapter 9.1, which served to give information about the discovery, their distribution and chronology as well as their ground plan and size.

Once again, the mapping of the sites (*fig. 201*) together with their ID helps with the fast location of enclosures. Name and ID of a site can be found in the associated table (**tab. 21*) that also serves as basic data for the information stated in chapter 9.1. For easy access to further information, citations were added (see Bibliography).

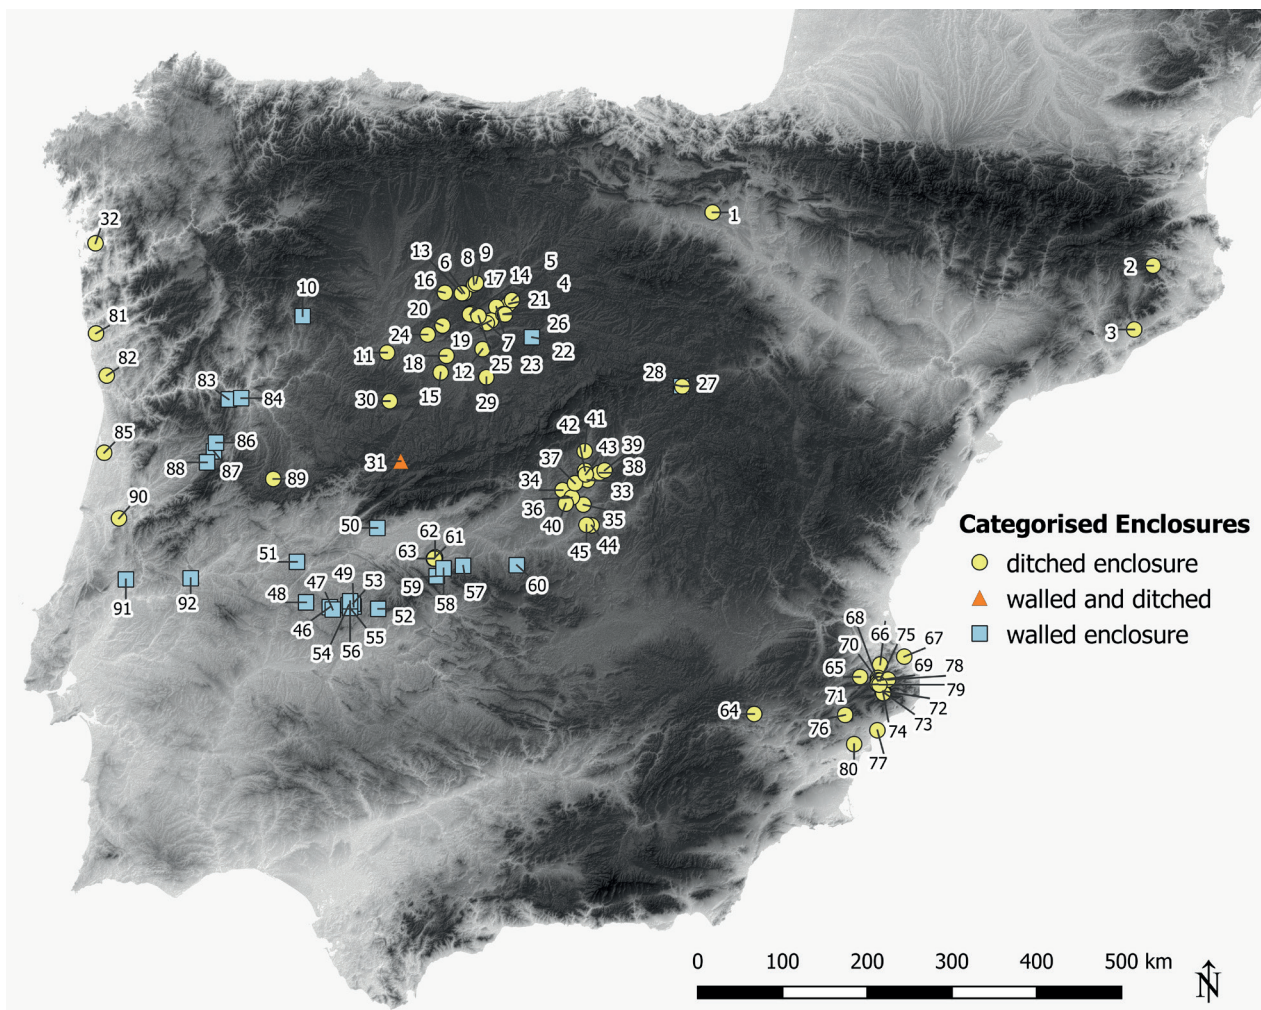

Fig. 201. The map shows the same information stated in Fig. 97 (chapter 9.1). It shows the distribution of mostly ditched and walled enclosures excluding the south and southwest of the peninsula.

| Id | Site | C.A., province, municipality | Mode of detection | Size | Plan | No. of ditches or walls | Excavated | Size of excavated area | Type | Important year(s) | Plan | Chronology | Selected publications |
